

Guide to the Tempus Molecular Profiling Integration with OncoEMR®

THE TEMPUS TESTING EXPERIENCE

- ✓ Seamlessly order Tempus testing on **one order form**
- ✓ Easily order tests tailored to your patient's diagnosis with **one-click ordering** through Tempus' Comprehensive Therapy Selection
- ✓ **Pre-populate order form fields** based on patient data in the EMR to enhance accuracy
- ✓ Easily track order status and access **PDF results directly within OncoEMR®** for quick reference

GETTING STARTED

Placing an Order

- 01** Navigate to the patient's "Treatment Plan", select "new orders", and search for "Tempus Oncology."
- 02** Order all Tempus tests on one order form with the ability to order multiple tests concurrently where appropriate.
 - Select "Comprehensive Therapy Selection", which includes DNA, RNA, and biomarker tissue testing tailored to your patient's cancer type. Ensure that the "current cancer diagnosis" field is appropriately filled out, and maintain the flexibility to add optional testing options such as liquid biopsy, hereditary testing and/or minimal residual disease (MRD) and monitoring tests.
 - If Comprehensive Therapy Selection doesn't fit within your workflow, you can also order tests a la carte.
- 03** To minimize errors, based on the panel selected at the beginning of the order, only eligible order fields and test options will be available to select.
- 04** Submit your order once it has been completed, or save it as a draft to be submitted at a later date.

Tracking and receiving results

After submission, a new line will appear on the patient's treatment plan for tracking order status. The order will also appear in the patient's collection record. Hover over the **i** icon to see which test was ordered and required specimens.

Ordering Tempus xM

- When ordering from Tempus' xM portfolio of MRD and monitoring tests, select the specific test and choose the testing cadence and quantity. By default, 12 months' worth of blood draws will populate, with the option to select fewer.
- After submitting the initial xM order, remaining xM blood draws will appear as pending on the patient's treatment plan. Subsequent orders will need to be released from the Treatment Plan before the time of blood draw. You can easily adjust future orders and add options like mobile phlebotomy for each blood draw.

Order Status and Results

View the patient's order status and results directly from the patient's treatment plan. All results are automatically delivered to the ordering provider's inbox for quick visibility.

To track the status of orders and view results across patients, you can use Shared Views in the Prior Authorization and Scheduling Group Inbox and set up filters. Additionally, practices can run the "Tempus Order Status Report" to view orders in a particular status.
